Photo Developing Solution

Photographic processing or photographic development is the chemical means by which photographic film or paper is treated after photographic exposure to produce a negative or positive image. Photographic processing transforms the latent image into a visible image, makes this permanent and renders it insensitive to light.

Photographic processing - Wikipedia

How to Develop Photos at Home (with Pictures) - wikiHow

In the processing of photographic films, plates or papers, the photographic developer is one or more chemicals that convert the latent image to a visible image. Developing agents achieve this conversion by reducing the silver halides, which are pale-colored, into silver metal, which is black. The conversion occurs within the gelatine matrix. The special feature of photography is that the developer acts more quickly on those particles of silver halides that have been exposed to light. Paper left

Photographic developer - Wikipedia

Not many people use film cameras anymore, so it can be hard to find the materials to develop your own photos at home since most local camera stores are closing. But it's actually relatively easy to make homemade developer, and you can make it with a few relatively common ingredients.
